Function, section, symbols: 3/2 directional poppet valve

General

Directional valves of type M-.SED are direct operated directional poppet valves with solenoid actuation. They control the start, stop and direction of flow and basically consist of housing (1), solenoid (2), valve seats (7) and (11) and closing element (4).

Manual override (6) allows the valve to be operated without energization of the solenoid.

Basic principle

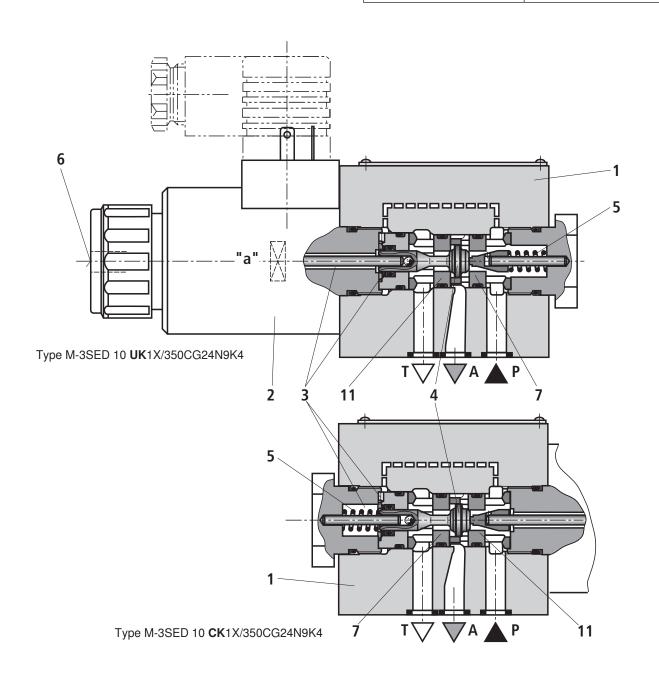

The starting position of the valve (normally open "UK" or normally closed "CK") is determined by the arrangement of spring (5). Chamber (3) behind closing element (4) is connected to port P and closed against port T. The valves are therefore pressure-balanced in relation to the actuating forces (solenoid and spring).

Due to the special closing element (4) ports P, A and T can be loaded up to a maximum operating pressure (350 bar [5076 psi]) and the flow directed in both directions (see symbols)!

In the starting position, closing element (4) is pressed by spring (5) onto seat (11), and in the operated position, it is pressed by solenoid (2) onto seat (7). The flow is leak-free blocked

Function, section, symbols: 4/2 directional poppet valve

With the help of a sandwich plate, the Plus-1-Plate, under the 3/2 directional poppet valve, the function of a 4/2 directional poppet valve can be realized.

Function of the Plus-1-Plate

- Starting position:

The main valve is not operated. Spring (5) holds closing element (4) on seat (11). Port P is closed, and A connected to T. In addition, a pilot line connects A to the large area of control spool (8), which is thus unloaded to the tank. The pressure applied via P now shifts ball (9) onto seat (10). P is now connected to B, and A to T.

- Transitional position:

When the main valve is operated, closing element (4) is shifted against spring (5) and pressed onto seat (7). This closes port T, while P, A and B are briefly connected.

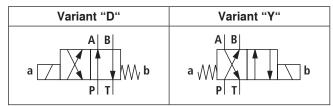

- Operated position:

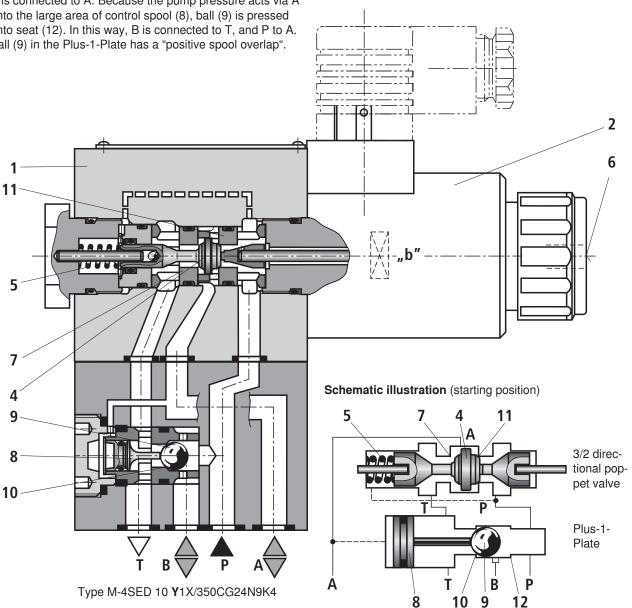

P is connected to A. Because the pump pressure acts via A onto the large area of control spool (8), ball (9) is pressed onto seat (12). In this way, B is connected to T, and P to A. Ball (9) in the Plus-1-Plate has a "positive spool overlap".

⚠ Attention!

To avoid pressure intensification when single-rod cylinders are used, the annulus area of the cylinders must be connected to A.

The use of the Plus-1-Plate and the seat arrangement offer the following options:

¹⁾ Suitable for NBR and FKM seals

For the selection of filters, see data sheets RE 50070, RE 50076, RE 50081, RE 50086, RE 50087 and RE 50088.

When establishing the electrical conection, properly connect the protective earth conductor (PE $\frac{1}{2}$).

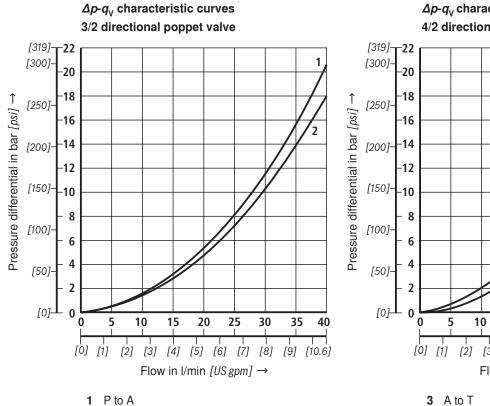

²⁾ Suitable only for FKM seals

³⁾ The cleanliness classes specified for components must be adhered to in hydraulic systems. Effective filtration prevents malfunction and, at the same time, prolongs the service life of components.

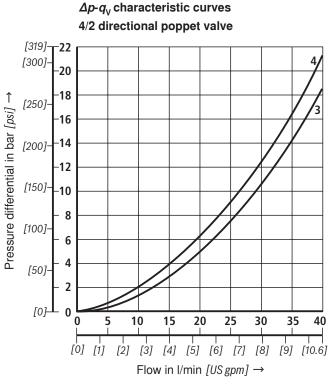

⁴⁾ Special voltages on request

⁵⁾ Due to the surface temperatures of solenoid coils, observe standards ISO 13732-1 and EN 982!

⚠ Attention!

Please observe the general notes below!

The performance limit was established when the solenoid had reached the operating temperature, at 10% undervoltage and no precharging of the tank.

General notes

Poppet valves can be used according to the symbols and the assigned operating pressures and flows (see Performance limits above).

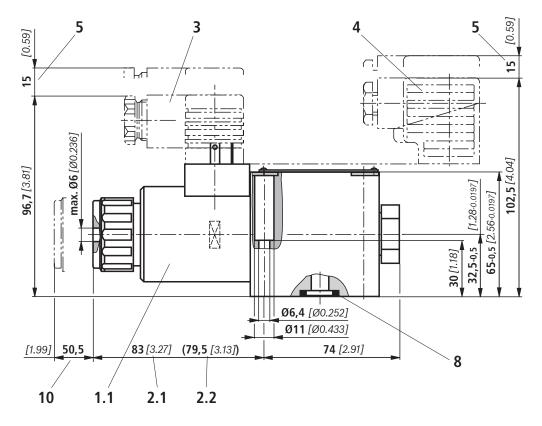

To ensure reliable operation, the following points must strictly be observed:

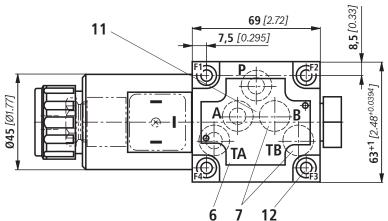

- Poppet valves feature a negative spool overlap, that is, during the switching process, a certain amount of leakage oil is produced. However, this process takes place within such a short time so that it is irrelevant in nearly all applications.
- The specified maximum flow must not be exceeded (if required, install throttle insert for limiting the flow, see page 13)!

Plus-1-Plate:

- When using the Plus-1-Plate (4/2 directional function), observe the following lower operating values: $p_{\min} = 8$ bar [116 psi], $q_{\text{V}} > 3$ l/min [0.8 US gpm].
- Ports P, A, B and T are clearly assigned in accordance with their tasks. They must not be freely interchanged or plugged!
- Port T must always be connected.
- Observe the pressure level and pressure distribution!
- The fluid may only flow in the direction of the arrow!
