¹⁾ For connection to the AC voltage mains, a DC voltage solenoid **must** be used, which is controlled via a rectifier (see table page 2).

A mating connector with integrated rectifier can be used (separate order, see page 13).

Standard types and units are contained in the EPS (standard price list).

Function, section, symbols: 2/2 and 3/2 directional seat valve

General

The directional valve type M-.SED is a direct operated directional seat valve with solenoid actuation. It controls start, stop and direction of the flow and basically comprises a housing (1), solenoid (2), valve seats (7) and (11) and closing element (4).

The manual override (6) allows for the operation of the valve without solenoid energization.

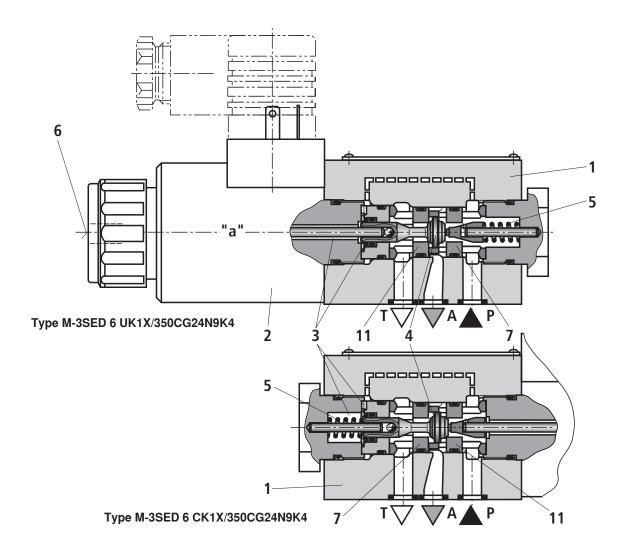

Basic principle (3/2 directional seat valve)

The initial position of the valve (normally open "UK" or normally closed "CK") is determined by the arrangement of the spring (5). The chamber (3) behind the closing element (4) is connected to port P and sealed against port T. Thus, the valve is pressure-compensated in relation to the actuating forces (solenoid and spring).

Due to the special closing element (4), ports P, A, and T can be loaded with the maximum operating pressure (350 bar) and the flow can be directed into both directions (see symbols)! In the initial position, the closing element (4) is pressed onto the seat (11) by the spring (5), in operated position onto the seat (7) by the solenoid (2). The flow is blocked.

With the 2/2 directional seat valve, the tank port is blocked internally.

Function, section, symbols, schematic illustration: 4/2 directional seat valve

With a sandwich plate, the Plus-1 plate under the 3/2 directional seat valve, the function of a 4/2 directional seat valve is achieved.

Function of the Plus-1 plate

- Initial position:

The main valve is not operated. The spring (5) holds the closing element (4) on the seat (11). Port P is blocked and A connected to T. One pilot line is connected from A to the large area of the pilot spool (8), which is thus unloaded to the tank. The pressure applied via P now pushes the ball (9) onto the seat (10). Thus, P is connected to B, and A to T.

- Transition position:

When the main valve is operated, the closing element (4) is shifted against the spring (5) and pressed onto the seat nected to each other.

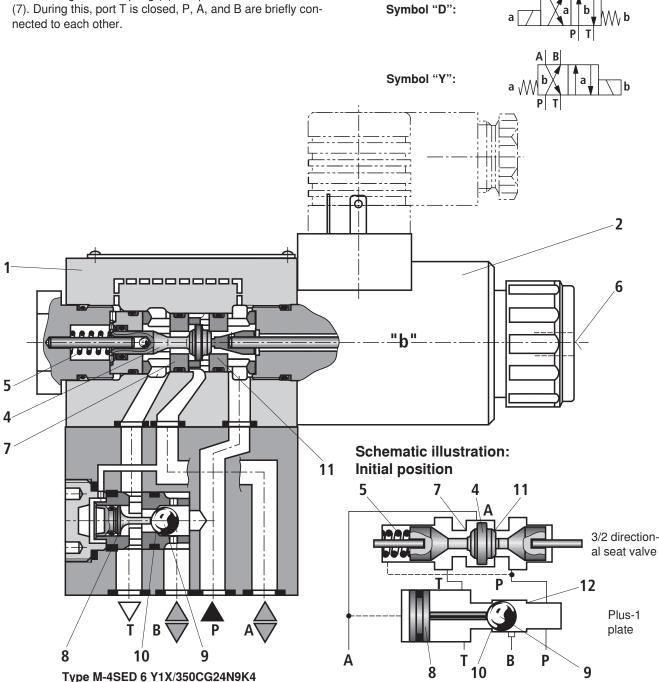

Spool position:

P is connected to A. Because the pump pressure acts via A on the large area of the pilot spool (8), the ball (9) is pressed onto the seat (12). Thus, B is connected to T, and P to A. The ball (9) in the Plus-1 plate has a "positive spool overlap".

Attention!

To prevent pressure intensification in conjunction with single-rod cylinders, the annulus area of the cylinder must be connected to A.

The use of the Plus-1 plate and the seat arrangement offer the following options:

¹⁾ Suitable for NBR and FKM seals

For selecting the filters, see data sheets RE 50070, RE 50076, RE 50081, RE 50086, RE 50087 and RE 50088.

When establishing the electrical connection, the protective earth conductor (PE $\frac{1}{=}$) has to be connected properly.

²⁾ Only suitable for FKM seals

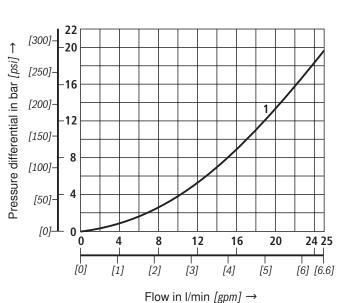

³⁾ The cleanliness classes specified for the components must be adhered to in hydraulic systems. Effective filtration prevents malfunction and at the same time increases the service life of the components.

⁴⁾ Special voltages upon request

⁵⁾ Due to the temperatures occurring at the surfaces of the solenoid coils, the standards ISO 13732-1 and EN 982 need to be adhered to!

Throttle insert

The use of a throttle insert is required when due to prevailing operating conditions, flows can occur during the switching processes, which exceed the performance limit of the valve.

Examples:

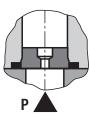

- Accumulator operation,
- Use as pilot control valve with internal pilot fluid tapping.

2/2 and 3/2 directional seat valve

The throttle insert is inserted in port P of the seat valve.

4/2 directional seat valve

The throttle insert is inserted in port P of the Plus-1 plate.

Check valve insert

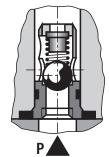

The check valve insert allows a free flow from P to A and closes A to P leak-free.

2/2 and 3/2 directional seat valve

The check valve insert is inserted in port P of the seat valve.

4/2 directional seat valve

The check valve insert is inserted in port P of the Plus-1 plate.

General notes

Seat valves can be used according to the spool symbols as well as the assigned operating pressures and flows (see performance limits page 8).

In order to ensure safe functioning, it is absolutely necessary to observe the following points:

- In order to switch the valve safely or maintain it in its spool position, the pressure situation must be as follows: $p_P \ge p_A \ge p_T$ (for design reasons).
- Seat valves have a negative spool overlap, i.e. during the switching process, leakage oil accrues. This process takes, however, place within such a short time that it is irrelevant in nearly all applications.
- The specified maximum flow must not be exceeded (use a throttle insert for limiting the flow, if necessary)!

Plus-1 plate:

- When the Plus-1 plate (4/2-directional function) is used, the following lower operating values must be taken into account: $p_{\min} = 8$ bar; $q_{\rm V} > 3$ l/min.
- The ports P, A, B and T are clearly determined according to the tasks. They must not be optionally exchanged or closed.
- With 3- and 4-way spool positions, port T must always be connected.
- Pressure level and pressure distribution must be observed!
- The flow is only permitted in the direction of the arrow!
